The G-protein coupled receptor polynucleotide and polypeptide are useful as pharmaceuticals or in the manufacture of medicaments for the treatment of obesity. They are useful in the diagnosis and treatment of diseases and disorders associated with signal transduction such as obesity, diabetes and metabolic disease, neurological disease, psychotherapeutics, urogenital disease, inflammation, cancer, tissue repair, dermatology, skin pigmentation, photogeing, frailty, osteroprofile additional processing and processing of the process of

                                                                    treating neurological disorders, including schizophrenia, ADHD/ADD (attention deficit-hyperactivity disorder/attention deficit disorder), and neuronal disorders such as Alzheimer's disease, Parkinson's disease migraine and senile dementia. Additional disorders include inflammatory
                                                                                                                                                disorder affecting the brain or a genetic predisposition, specifically schizophrenia. ngPCRx are useful for identifying compounds useful for treating schizophrenia. Detection of ngPCRx in a sample is useful as a diagnostic tool for diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis, CNS disorders, infections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and
                                        conditions (e.g. Cradisorders, cancers,
                                                                                                                                                                                                                                           The present invention relates to novel G protein-coupled receptors (nGPCRX; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences. The present sequence is one such G protein-coupled receptor. GPCRs are also known a seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a diagnose receptors are useful for screening a human to diagnose a

Agonists or antagonists of IGS4 are effective with regard to disorders of the nervous system, including the central and peripheral nervous systems, disorders of the gastrointestinal system, cardiovascular system, skeletal muscle, thyroid, lung or genitourinary system, or immunological disease. The IGS4 polynucleotides are useful as diagnostic reagents for detecting under-expression, overexpression or altered expression of IGS4.

IGS4 exists in two polymorphic forms, IGS4A and IGS4B. The IGS4 receptors and IGS4 polynucleotides are useful for preventing, ameliorating or correcting dysfunctions or diseases. These diseases include peripheral nervous

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     These diseases include peripheral nervous system, psychiatric and central CC nervous system disorders (e.g. schizophrenia, episodic paroxysmal CC anxiety, phobia, Parkinson's disease, migraine, epilepsy, bulimia or cystroke), cardiovascular diseases (e.g. heart failure, angina pectoris, CC myocardial infarction or hypertension), dyslipidemias, obesity, emesis, cg qastrointestinal disorders (e.g. inflammatory bowel disease or motility CC disorders), osteoporosis, inflammations, infections (e.g. bacterial), CC fungal, protozoan or viral), pain, cancers, immune disorders, allergies, csepsis or gynecological disorders of the nervous system, including the CC entral and peripheral nervous systems, disorders of the gastrointestinal csystem, cardiovascular system, or immunological disease. The IGS4 polynucleotides are useful as diagnostic reagents for detecting under-expression, coverexpression or altered expression of IGS4.

IGS4 exists in two polymorphic IGS4A and IGS4B. The IGS4 receptors and IGS4 polynucleotides are under the control of the IGS4 receptors and IGS4 polynucleotides are under the IGS4B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New G-protein coupled receptors and useful for preventing, ameliorating disorders, cardiovascular diseases,

                                                                                                                                                                                                                                                                                                                                                                                                        for preventing, ameliorating or correcting dysfunctions or diseases.

C These diseases include peripheral nervous system, psychiatric and central nervous system disorders (e.g. schizophrenia, episodic paroxysmal central canxiety, phobia, Parkinson's disease, migralne, epilepsy, bulimia or stroke), cardiovascular diseases (e.g. heart failure, angina pectoris, myocardial infarction or hypertension), dyslipidemias, obesity, emesis, castrointestinal disorders (e.g. inflammatory bowel disease or motility disorders), osteoporosis, inflammations, infections (e.g. bacterial, fungal, protozoan or viral), pain, cancers, immune disorders, allergies, ceffective with regard to disorders agonists or antagonists of IGS4 are ceffective with regard to disorders of the nervous system, including the central and peripheral nervous system, disorders of the gastrointestinal central and peripheral nervous system, disorders of the gastrointestinal central and peripheral nervous system, disorders of the gastrointestinal constitution or immunological disease. The IGS4 polynucleotides are useful as diagnostic reagents for detecting under-expression, concerns as a constitution or alternal expression of IGS4.

The present amino acid sequence is the hRUP6, an endogenous human orphan G protein-coupled receptor (GPCR). The full length hRUP6 cDNA was cloned by RT-PCR using human thymus cDNA as template. The orphan GPCR of the invention, like all GPCRs has seven transmembrane alpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the identification of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins may also be used in the study of GPCR-mediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue localisation expression analysis to provide information about their
                                                                                                                                                                                                                                                                                                                                                                                                                                  29-SEP-1

More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents. AAA46126 and AAA6126 and AAA6285 represent sequences used in the compounds of the compounds of
